

Recovery is replay, not recollection

A crash mid-mission. The record - not the model - reconstructs what happened, and the same mission resumes with its evidence intact.

every request, effect, and verdict is already a canonical, hash-linked event - large payloads live in a content-addressed store

replay reads the consistent prefix; the torn tail is detected and discarded

replay restores

- full transcript + tool results
- step, refusal, and cost counters
- billed spend to the cent
- registered tools and config

the same mission continues

what does not happen

- × no new mission with a fresh identity
- × no model-written summary of the past
- × no lost child-agent work or ledger entries
- × no reset budgets

a resumed mission carries its transcript, counters, ledger, and cost - continuity is a property of the record, not the prompt
